

**M E M O R A N D U M**

**DATE:** September 29, 2009  
**TO:** Kansas-Lower Republican and Missouri BAC and Agency Advisors  
**FROM:** Susan Metzger and Margaret Fast, Kansas Water Office  
**SUBJECT:** October 15, 2009 Meeting

---

The next Kansas-Lower Republican and Missouri Basin Advisory Committee (BAC) meeting is scheduled for **Thursday, October 15<sup>th</sup>, 10:00am, at the Horton High School (1120 First Avenue East) in Horton, KS.** This meeting will be a joint meeting with the members of both the Kansas-Lower Republican and Missouri BACs.

This meeting will focus on activities related to a common basin priority issue: Watershed Restoration and Protection. Updates on basin WRAPs activities will be presented by Daniel Howell, KLR BAC member and Carl Johnson, MO River Basin Coordinator. The highlight will be a presentation by Jim Whisenant, Horton City Administrator, on the Mission Lake dredging project. An opportunity to tour the lake and sediment disposal area will follow the meeting.

Each committee will briefly meet separately to take care of basin specific business. The MO BAC has one applicant to consider for membership in an at-large category. Both committees will receive an update on the *Kansas Water Plan* and Kansas Water Authority activities. Included in your materials is the Reservoir Roadmap Volume II: Statutory Changes. The KWA requests comments on these recommendations concerning the sustainability of our reservoirs and the related water supply issues.

Included with this memo are the following meeting materials:

- Agenda
- Press Release
- Budget Memo
- Budget Table
- Reservoir Sustainability Initiative Memo
- Reservoir Sustainability Initiative Volume II Statutory Section
- Basin Priority Issue Status Table
- Membership Application (\*\*Missouri BAC only)

If you have any questions, please call or e-mail Susan Metzger or Margaret Fast (785-296-3185 or [susan.metzger@kwo.ks.gov](mailto:susan.metzger@kwo.ks.gov) or [margaret.fast@kwo.ks.gov](mailto:margaret.fast@kwo.ks.gov)). Please notify the office in advance if you are unable to attend.

**Joint Meeting of the  
Kansas-Lower Republican and Missouri  
Basin Advisory Committees  
10:00 a.m., October 15, 2009  
Horton High School  
1120 First Avenue East  
Horton, KS 66439**

**AGENDA**

- 1. Welcome and Introductions**
- 2. BAC Approval of Agenda**
- 3. Agency Reports \***
- 4. Public Comments \*\***
- 5. BAC Business**
  - a. Approval of July Meeting Notes
  - b. Kansas Water Authority – August 13-14 meeting
  - c. BAC member reports of activities, contacts, meetings etc.
  - d. BAC Membership
- 6. Basin Activities**
  - a. Mission Lake Design-Dredge Water Supply Restoration Project – *Jim Whisenant, City of Horton*
  - b. Missouri Watershed Restoration and Protection Strategy (WRAPS) – *Carl Johnson*
  - c. Tuttle Creek WRAPS – *Daniel Howell*
  - d. Reservoir Sustainability Initiative: Reservoir Roadmap – *Susan Metzger and Margaret Fast, KWO*
- 7. Other Business**
  - a. Messages to the Kansas Water Authority
  - b. Kansas Water Authority meeting: November 17-18 in Liberal
  - c. Next KLR & MO Meeting Dates: February/March
  - d. Water Issues Forum – Climate and Water: Planning for Change. December 9 in Wichita and December 10 in Hays
- 8. Adjourn**

**Following the conclusion of the regular business meeting, members of the BAC and those in attendance will have the opportunity to view components of the Mission Lake Dredging project.**

Note: underlined items are action items for BAC.

\*Oral Agency Reports are limited to 5 minutes, written reports are welcome.

\*\*Public Comments are limited to 2 minutes per speaker on water resource issues and concerns. Other comments should be addressed to the Director of KWO.

### **NEWS RELEASE**

---

FOR IMMEDIATE RELEASE

September 25, 2009

Kansas-Lower Republican and Missouri  
Joint Basin Advisory Committees  
10 a.m., Thursday, October 15, 2009  
Horton High School  
1120 First Avenue East  
Horton, Kansas

Members of the Basin Advisory Committees in the Kansas-Lower Republican and Missouri River basins will have a firsthand look at work underway to restore Mission Lake as a public water supply source. Their field trip will take place after a joint committee meeting of the committees scheduled for 10 a.m., Thursday, October 15, 2009 at Horton High School, 1120 First Avenue East, Horton, KS.

Restoration of Mission Lake is a pilot project jointly funded by the City of Horton and the State Water Plan Fund. The project is designed to determine the economics and effectiveness of dredging a lake to restore its water storage capacity. Removing sediment by dredging, coupled with upstream watershed soil protection measures, is expected to help the lake meet Horton's current and future water supply needs.

Work at Mission Lake is a solid example of the state's broader Reservoir Sustainability Initiative (RSI) begun in 2007 by the Kansas Water Authority. The RSI is a comprehensive set of activities to address sedimentation in reservoirs and the corresponding loss of storage. As a complement to the Initiative, a Reservoir Roadmap is being developed at the request of the Kansas House of Representatives Vision 2020 Committee. Included in the Roadmap are potential statutory changes that would help sustain the reservoirs and insure adequate future water supply. Members of the two BAC committees will consider the Roadmap's suggested statutory and budgetary needs. Volumes I and II of the Reservoir Roadmap are available on the Kansas Water Office's webpage at <http://www.kwo.org/ReservoirRoadmap.htm>.

The meeting will also include presentations on Watershed Restoration and Protection Strategies by representatives of the Missouri and the Tuttle Creek WRAPS groups. WRAPS membership includes stakeholders committed to making a difference in all aspects of watersheds. Special emphasis is placed on watersheds above public water supply sources.

The Kansas-Lower Republican and Missouri committees and other BACs in the state will co-host the Climate and Water forums to be held December 9, 2009 in Wichita and December 10, 2009 in Hays. The meetings are designed to increase awareness of the possible effects of a changing climate on water resources and the state's economy. Co-hosts are the Kansas Water Office and the Kansas Center for Agricultural Resources and the Environment (KCARE). The public is encouraged to participate.

For additional information about the October 15, 2009 meeting or an electronic registration form for the Climate and Water Forum, please go to the Kansas Water Office web site [www.kwo.org](http://www.kwo.org).

**Note to media:** The Kansas Water Office coordinates the Kansas water planning process in concert with the Kansas Water Authority. The Authority's 24 members include representatives from diverse water use interest groups and leaders of the state's natural resource agencies.

Advice on policy development comes from Basin Advisory Committees in each of the state's 12 river basins and other local stakeholders. The Authority, in turn, advises the Governor and Legislature on water issues to be considered for policy enactment.

---

The Kansas Water Office is the water planning, policy, and coordination agency for the State of Kansas. It prepares a state plan of water resources development, management and conservation, reviews all water laws, and makes recommendations to the Governor and Legislature for new or amendatory legislation. The Office administers the *Kansas Water Plan Storage Act*, the *Kansas Weather Modification Act*, and the *Water Assurance Act*. It also reviews the plans of any state or local agency for the management of the water and related land resources of the state.

Water planning in Kansas is an open process.

**Note to Editor:** The Americans with Disabilities Act, (42 U.S.C. 12101), requires the Kansas Water Office to print the reasonable accommodations message.

If accommodations are needed for persons with disabilities, please notify the Kansas Water Office at 901 S. Kansas Avenue, Topeka, KS 66612-1249 or call (785) 296-3185 at least two days prior to the meeting.

**M E M O R A N D U M**

**DATE:** September 15, 2009  
**TO:** Basin Advisory Committees  
**FROM:** Tracy Streater, Director  
**SUBJECT:** FY 2011 State Water Plan Fund Budget Recommendations

Attached are the FY2011 State Water Plan Fund (SWPF) recommendations adopted by the Kansas Water Authority at their August Meeting in Salina. These recommendations were initially reviewed and adopted by the KWA Budget Committee during meetings held prior to the KWA Meeting. Don Paxson serves as Chair of the Committee along with Lisa French, David Corliss, Gary Baker and Steve Irsik.

The KWA recommendations propose the expenditure of \$19,605,820 for FY2011. This total includes the full demand transfer from the State General Fund (SGF) and is based upon fee projections which are 3.7 percent less than last year's projections, mostly due to declining water use fees paid by public water suppliers. Overall, the amount of projected available funds for FY2011 (assuming the full \$6 million SGF transfer) is \$1.16 million less than was projected for FY2010. As a result, the recommendation for most SWPF programs is less than last year's recommendation.

In addition to normal SWPF expenditures, the KWA also recommended, as it did a year ago, ten percent of the Expanded Lottery Act Revenues Fund (ELARF) be dedicated to debt reduction and infrastructure projects. Revenue projections for FY2011 ELARF are not available at this time. However, the KWA is requesting \$5.4 million in ELARF funding for FY2011 to begin the purchase of storage at Perry and Milford Reservoirs, partial funding to implement a potential minimum pool agreement at Webster Reservoir, streambank restoration projects above federal reservoirs and funding for dam safety and rehabilitation projects.

Please note on the attached table a column entitled *FY 2010 Revised*. This column illustrates changes that have occurred since the adjournment of the 2009 Legislature. As a result of continuing decreases in State General Fund revenue, the Governor found it necessary in early July to reduce the FY 2010 budget approved by the Legislature. As a result, the \$3.295 million SGF transfer to the SWPF will not be made this year. The majority of the impact of this action can be seen in the budget line items of the State Conservation Commission and Kansas Water Office.

On a final note, the KWA Budget Committee has begun a process to identify potential new funding strategies for State Water Plan projects. In early August, the Committee convened a group of stakeholder groups to discuss future funding options. Staff are reviewing funding sources used by other states for water and natural resources and will be sharing this information with the Budget Committee and stakeholders at a meeting scheduled for October 14. This group will continue to meet through 2010. It is not anticipated that any proposals will be available for consideration by the 2010 Legislature.

**M E M O R A N D U M**

**DATE:** September 11, 2009  
**TO:** Basin Advisory Committee members and advisors  
**FROM:** Susan Metzger, Deb Baker, Diane Coe, Hank Ernst, Margaret Fast, Bobbi Wendt  
**SUBJECT:** Reservoir Sustainability Initiative / Reservoir Roadmap

---

During the 2009 Legislative session, the Kansas House Vision 2020 Committee discussed the issue of reservoir sustainability and sedimentation. One of the items they requested was that by January 2010 the Kansas Water Authority deliver to the Kansas Legislature a report on actions necessary to insure an adequate future water supply for areas currently or potentially served by federal, state or municipal reservoirs. Several agencies have been active in developing this report, known as the Reservoir Roadmap. Aspects of the report have been reviewed by the Kansas Water Authority at their April, June and August meetings.

The Reservoir Roadmap report is organized into three volumes:

1. Quantification of the Issue – Statewide Perspective
2. Statutory and Budget Considerations
3. Basin Approach to Reservoir Sustainability

The draft contents of Volumes I and II are available on the Kansas Water Office webpage at <http://www.kwo.org/ReservoirRoadmap.htm>. Included in your mailing materials for discussion at the Basin Advisory Committee meeting is a chapter of Volume II which includes the recommended statutory changes to assure reservoir sustainability.

The changes are presented as components of a comprehensive Kansas Reservoir Sustainability Act. The goal of this act would be to provide authority to the state of Kansas to secure, protect and restore reservoir storage to meet the needs of the citizens of Kansas. These components could also be considered “a la carte”, requiring changes to several existing and new statutes and regulations. While this approach could be considered, it would be labor intensive, requiring significant staff and legislative time, and may not completely address all aspects of needed change.

A presentation will be made to the BAC during your meeting by a staff member of the Kansas Water Office. The presentation will provide an overview of the full Reservoir Roadmap and details of the components of the recommended statutory changes. Your input and feedback on these recommended changes will be important in the development of potentially significant legislation.

Volume III is currently being developed and will be presented to the KWA in November 2009. The Neosho basin has been selected as a pilot basin for Volume III. This Volume will also contain a schedule for similar analyses of the remaining basins.

The entire report will be presented to the Legislature during the 2010 session, after review of the final document by the KWA.

## **VOLUME II: RESERVOIR ROADMAP RECOMMENDED STATUTORY CHANGES**

A review of state and national water resource policy was conducted as part of the Reservoir Sustainability Initiative. Several policies were focused on in the development of the Reservoir Roadmap. Following is a discussion of the statutory issues requiring resolution if the state of Kansas is to secure, protect, and restore the state's reservoirs to meet the needs of the citizens in the 21<sup>st</sup> century.

Addressing necessary statutory changes could be accomplished in a piecemeal fashion in which individual statutes or regulations are reviewed and modified. However, this process will be labor intensive, require significant staff and legislative time, and may not completely address all aspects of needed change. Therefore, the recommendation is to create a comprehensive Kansas Reservoir Sustainability Act (RSA) with the following goal:

*The State of Kansas will have the authority to secure, protect and restore reservoir storage needed to meet the water supply needs of the citizens of Kansas.*

Many of the individual recommendations in the Protect and Restore categories were previously considered and approved in the *Enhanced Stream Corridor and Wetland Management to Address Sedimentation* policy section, the *Flood Damage Mitigation and Small Dam Safety* policy section and *Institutional Framework* management section of the *Kansas Water Plan*. Implementation of these recommendations would be included within the Kansas Reservoir Sustainability Act.

Establishment of a comprehensive Kansas Reservoir Sustainability Act (RSA) involves each of the natural resource agencies. With assistance from these agencies, the Kansas Water Authority would maintain the overall responsibility of identifying reservoir sustainability needs through the public process of the *Kansas Water Plan*. Specific projects and activities resulting from the RSA would be identified in the *Kansas Water Plan*, Water Issue Strategic Plans, the Water Marketing/Assurance Programs Capital Development and Storage Maintenance Plan and the Water Resources Capital Development Plan, as appropriate.

### **SECURE**

#### ***Debt Service on Storage in Federal Reservoirs***

Kansas has contracts with the U.S. Army Corps of Engineers (Corps) for purchase of almost a million acre-feet of storage in 13 reservoirs; just over half of that storage is currently under a repayment agreement. The state makes annual principal and interest payments on that in-service storage. In addition, operation and maintenance costs for the in-service storage are paid annually. Currently, the customers of the Water Marketing program pay those costs. The ability to cover the increasing costs for principal and interest and operation and maintenance is limited because the majority of revenue in the Water Marketing program comes from fixed rate contracts. The rate for customers of the Marketing Program that have contracts signed since 1983 changes annually but represents only 20% of the revenue stream.

Efforts to provide additional funds to service this debt and to secure additional storage have been proposed and discussions are underway to determine the best method for doing this. The potential for the federal government to relieve part of the debt is part of the discussion and the state may need statutory authority to partner with the federal government if debt relief agreements can be negotiated.

#### ***Unfunded Liability***

The storage under contract, but not yet in-service and committed to a customer, represents an unfunded liability in the program. The 2008 Legislature recognized this issue, and the concern that until a repayment agreement is in place, the state does not control use of that storage for the benefit of its citizens. In response, the Legislature created the Reservoir Storage Beneficial Use Fund to be used to buy additional

storage before the state has a customer to repay the cost to purchase, operate and maintain the storage. While this is a significant step toward securing storage, the appropriation is insufficient. While no statutory change is needed, there is a significant funding impact.

In addition, state statute requires a commitment on the part of a user to bring the water into service and begin paying for it before the state enters into repayment agreements to the federal government. To secure additional storage in existing reservoirs for future use, this requirement may need to be removed. (See Volume II, Chapter 2 – Funding Needs.)

### ***Purchase of Additional Storage in Federal Reservoirs***

There are a few situations in which additional storage could be obtained in existing federal reservoirs. Melvern, Wilson and Kanopolis, while all very different situations, each present an opportunity for providing additional storage. As mentioned above, to secure additional storage in existing reservoirs for future use, the requirement for the water to be in-service may need to be removed.

### ***Expansion of Access to Storage***

Though state planning statutes recognize multiple and broad public benefits of reservoirs, the right to use water supply that is stored in Corps reservoirs is currently limited to contracts under the Water Marketing Program, membership in a water assurance district, and in a very few instances, contracts directly with the federal government. In all cases, use of the water is designated either by statute or by contract, for municipal and industrial users only. There are times when a more flexible operation of the river/reservoir system could meet additional needs; however, legal access to storage released is limited. Approaches that will work with current and local conditions to allow the use of storage to meet contemporary needs, yet respecting current commitments under contract, ownership, and appropriation rights are needed.

### ***Development of New Large Reservoirs***

From the 1940's through the 1970's the federal government developed large reservoirs in the state of Kansas, constructed primarily for flood control purposes. Other purposes such as water supply, water quality, irrigation, recreation and fish and wildlife habitat were included based on the projected need, and in some cases, local interest.

The state recognized the value of these reservoirs as a public water supply resource and purchased available storage from the federal government. Likewise a number of cities purchased storage in federal reservoirs, notably Wichita and El Dorado. The water was then made available to municipal and industrial users under the Water Marketing and Water Assurance Programs. Two-thirds of the population of Kansas is now directly or indirectly dependent on storage in these reservoirs. As population grows and existing reservoirs fill with sediments, new surface water storage facilities may need to be developed (see Volume I, *Supply and Demand Projections* chapter).

Future water supply storage may also be achieved by off stream storage in some basins. Offstream refers to a water body or system that is not located in a streambed or does not receive significant natural flows from the surrounding watershed. An example is a reservoir that is not located on a streambed, and is supplied by a pipeline, aqueduct or an adjacent stream. Aquifer storage and recharge using excess river flows is also considered to be offstream storage.

The federal government has no plans or authority to develop additional water supply storage in Kansas. Therefore, it is recommended under the Kansas RSA to establish authority for the state to initiate the development of water supply reservoirs and other means of storage.

## ***Secure Reservoir Sites for Future Development***

During the time that the federal government was actively developing reservoirs, the Corps and the Bureau of Reclamation (Bureau) selected the most feasible reservoir sites from a cost benefit evaluation. A number of sites were identified, analyzed and eliminated from consideration on this basis. Reservoir sites not initially developed by the Corps are in some cases in close proximity to growing urban areas, enhancing their benefit. Such sites may be threatened by development of suburban growth, potentially precluding their development to meet future water supply needs.

In order to ensure the ability to provide adequate water supply for the future, the state should have the authority to protect reservoir and other storage sites for future water supply from development or other restrictive activities. The RSA should contain authority for the state to identify sites in the best locations for future water storage. A means should be developed to ensure that planned uses of the site do not preclude its suitability for future water storage,

### ***Development of Small Reservoirs***

In some areas, additional surface water storage may be needed for water supply. In addition, the value of a lake for local recreational purposes and the associated economic value to the region are recognized. Though the state can participate in public water supply and recreation storage under existing state law, flood control storage must be included as one of the purposes. Since enactment of this statute, the need for water supply reservoirs has emerged in locations where flood control was not a primary issue. This provision has prevented state participation in development of single purpose water supply reservoirs. Under a comprehensive Kansas RSA, authority could be provided to the State of Kansas to cooperate with local units of government or private entities for the development of small lakes for any purpose, whether single or multipurpose. Requirements that flood control be included should be removed.

### ***Minimum Pool Agreements for Recreation***

A stable reservoir water pool supports recreational uses for access to boat ramps and fisheries habitat, and increases support to the local economy. The State Water Plan Storage Act recognizes the value of recreation, therefore, no state statutory changes are recommended. However, greater coordination and evaluation efforts are needed to identify reservoirs that could provide greater opportunities for recreation. For example, discussions are underway to determine if irrigation storage can be leased to provide additional recreational benefits at Webster Reservoir. Changes to federal authority for the Bureau of Reclamation may be needed so that they may more freely participate in planning and evaluation of potential minimum pool agreements.

## **PROTECT**

### ***Protect Kansas Reservoirs through the Implementation of Best Management Practices (BMPs)***

Water resources within Kansas are vital to the state for not only supplying a growing population but for the economic welfare of the state. The state has a vested interest in protecting the storage in the federal reservoirs in which two-thirds of the population depends on for its water supply. Land surface BMPs in target areas above reservoirs can help to reduce sediment loads. These practices can take the form of terraces, waterways, residue management, grade control structures, dams and other practices that reduce or eliminate sediment and nutrient loading to the reservoirs. There are well established cost share mechanisms for these traditional conservation practices. While no statutory change is needed, the recognition of the vital role these practices play is a component of a comprehensive reservoir sustainability initiative.

## ***Riparian and Wetland Protection and Development***

The protection of riparian and wetland areas, when systematically implemented and targeted above water supply reservoirs, may significantly reduce future sediment loads, extending storage capacity. The state currently provides cost-share assistance on wetland and riparian establishment and restoration. When matched with other state and federal programs, the total cost-share allowable to a participant is not to exceed 80% of the total cost of the practice, and in some cases cost share may be 90% of the total cost. In areas above federal reservoirs, the state's interest in the conservation practice may exceed the interest of the individual landowner, who may choose not to participate in the voluntary practice if financial input on his/her part is required. In those instances, the cost for project planning and implementation should be entirely the responsibility of the state. The RSA should give authority for the state to provide 100% funding for conservation project planning and implementation, when substantial state interest is demonstrated.

Protection of high value conservation resources often involves the purchase of a conservation easement. While the state does have the authority to accept donated easements, there is not a dedicated source of funding that could be drawn from to purchase targeted high value easements. The ability should be developed in the RSA to establish a dedicated conservation easement fund.

### ***Protect Streambanks through Stabilization Projects on a Stream Segment Approach***

Increasing evidence exists that streambank erosion contributes to significant sedimentation in reservoirs. An approach that targets entire reaches for stabilization, instead of individual scattered sites, is more effective. State statute currently requires that federal funding be available before the state participates in a streambank stabilization project when a systematic approach is utilized. State statute emphasizes local responsibility for a streambank stabilization project. While coordination with local landowners and community members is essential to a successful project, requirement for local sponsorship and cost-sharing can be a significant limiting factor due to the high cost of stream stabilization projects. The recommended statutory approach is to allow for 100% state responsibility in the coordination, planning and implementation of systematic stream stabilization projects in targeted areas. In addition, the statutory requirement for federal funding should be removed.

In May 2009, the Kansas Water Office received funding through the American Reinvestment and Recovery Act to conduct a streambank stabilization and riparian restoration project on an eight-mile reach of the Neosho River above John Redmond Reservoir. Implementation of this project will serve as a pilot, illustrating the type of local coordination and funding needs required for this systematic approach.

## **RESTORE**

### ***Restoration of Water Supply Storage Capacity through Dredging of Municipal, State and Federal Reservoirs***

In many reservoirs, especially those in which significant BMPs and streambank stabilization efforts have already been implemented in the contributing watershed, dredging may be a viable alternative for restoring water supply storage capacity. Through successful pilot projects such as at Mission Lake, the state is gaining the knowledge and expertise to facilitate similar projects at other reservoirs. Based on the experience of planning and implementing a pilot dredging project at Mission Lake, a successful dredging project requires coordination with many entities. These agencies include, but are not limited to, the State Conservation Commission, Kansas Water Office, Kansas Department of Health and Environment, Kansas Department of Wildlife and Parks, Kansas Department of Agriculture, Kansas Department of Transportation, the Corps and Bureau, local municipalities, legislators, and local citizens. Coordination among these entities is necessary to provide for complete collaboration and to expedite permitting and review processes. The RSA should provide for clear and comprehensive state authority for coordination of all aspects of a systematic dredging program for the purposes of water supply storage capacity restoration.

## ***Dam Safety and Rehabilitation***

Nearly 6,000 small dams in Kansas are regulated by the Kansas Department of Agriculture, Division of Water Resources. Of these, 180 are classified as high hazard with an additional 247 classified as significant hazard. Most dams were constructed with a 50-year design life and the average age of these dams is 40 years. These dams have been constructed to provide flood control, public water supply, recreation and other benefits. Many were built by local watershed districts using federal or state cost-share assistance and local funds. Others have been constructed by municipalities, private organizations or individuals, and the state.

In November 2005, the Kansas Water Authority adopted a *Kansas Water Plan* policy section for small dam safety and rehabilitation. Recommendations were made for development of breach inundation maps and notification of downstream landowners. Inundation maps for new dams should be filed with the county registrar of deeds. Local downstream landowners should be notified by the registrar and information about the potential flooding if a breach occurs should be attached to the deed.

Where development downstream of an existing dam owned by a public entity such as a municipality or a watershed district results in a hazard class increase, notice should be given to property owners within the breach inundation area of the dam and the levying of a special assessment against these property owners for the purpose of making necessary modifications to the dam consistent with the design standards of the new hazard class should be authorized. The owner of a dam should not be held liable for damages caused by breach of the dam to real property developed after the landowner had been made aware of the location of possible flooding. This limitation should not affect liability for personal injury or death caused by breach of a dam.

Additional watershed and other dams require rehabilitation due to deferred maintenance, age or extreme floods or other natural phenomena. The cost for rehabilitation of existing dams is substantial. A cost benefit analysis for rehabilitation of these dams should be performed to determine if decommissioning of the dam is more cost effective than repair. When dam repair is the better option, and the dam owner can effectively demonstrate that the needed repairs are not due to negligence, state cost share could be provided to ensure the safety of the dam.

The state should establish a cost-share program to assist eligible dam owners in paying for needed dam rehabilitation and upgrade measures.

## **CONCLUSION**

The Kansas Reservoir Sustainability Act would provide a comprehensive approach to secure, protect, and restore the state's water resources to meet the needs of the citizens. Equally important to the recommended statutory changes is funding. A discussion of the recommended financial resources to meet anticipated needs is provided in the following chapter.

## Missouri Basin Priority Issues

### Priority Issue: Missouri River Bed Degradation Impacts

**Issue Description:** Lowering of the Missouri River bed in the reach bordering Kansas threatens water intakes, bridge abutments and other “hard points” along the river channel. Wildlife habitat in the river and along its banks has also been negatively impacted by channel degradation.

Recommended Actions	Status	Comments
1. Investigate the application in Kansas of infrastructure modifications from other states with similar conditions.	Delayed implementation	
2. Monitor impacts to riparian habitats and species related to degradation.	Underway - Assessment of aquatic & riparian habitat along the Missouri River and tributaries experiencing head cut are components of the Corps Feasibility study. Task activities are planned for calendar year 2010.	See comments under item 4.
3. Conduct an inventory of bridges, pipelines and other channel infrastructure considered to be susceptible to bed degradation.	Underway - Component of Corps Feasibility study; task activities are planned to begin July 2010.	See comments under item 4. Some information has been assembled as a component of the dredging EIS (in development) and will be evaluated for data and findings.
4. Monitor and assist with the U.S. Army Corps of Engineers reconnaissance study of bed degradation on the Missouri.	Recon study is complete.	Recon study complete. Feasibility Study being scoped and partners sought; signing of the cost-share agreement should occur late fall 2009. Feasibility study will be conducted in three phases. Phase I is anticipated to begin in Feb. 2010 & end in Aug. of 2012. Phase I will include data assembly & inventory development for baseline conditions. Phase III is expected to conclude in Aug. of 2016.
5. Track the cost of past and ongoing repair for retrofit of water intakes (power and water supply) required due to bed degradation	Underway - Economic data on property and infrastructure is a component of the Corps Feasibility study; Cursery assembly of information began during the reconnaissance study and will be refined in phase I.	See comments under item 4.

### Priority Issue: Increased Water Recreation Use and Access

**Issue Description:** A lack of access to water-based recreational resources in the Missouri basin inhibits recreational activity and the associated economic, educational and stewardship benefits.

Recommended Actions	Status	Comments
1. Evaluate the placement of existing access points on the Missouri River in both Kansas and Missouri, to determine the need for additional access points in Kansas.	Delayed implementation	

2. Encourage recreational use of private lands through access programs such as walk in hunting and fishing and other programs administered by Kansas Department of Wildlife and Parks.	Ongoing	
3. Develop recreational opportunities on Missouri River Mitigation Program properties as consistent with the primary purpose of habitat restoration.	Benedictine Bottoms is open; permit system for hunters Oct - March. Boat ramps are available near the Elwood and at Atchison.) Public comment period on the Dalbey Bend site, S of Atchison, has closed and the COE is responding to concerns regarding sediment that were raised. In addition, the COE has acquired another small (120 ac) NW of Troy (Burr Oak bottoms.)	The Dalby site, acquired by the COE, is 1600 acres south of Atchison. KDWP is about 95% through the planning process for this tract and may actually start some construction this fall. All of this tract is contiguous as well as adjacent to the MO river. Although there will not be direct vehicle access to the river, this recovery project will create three new "chutes" along this river corridor that will be the first major project of this type on the KS side.
4. Emphasize the educational potential of existing water resources through interpretive signage and programs.		Corps of Engineers has had primary involvement.
5. Investigate non-governmental support and funding to develop water-related recreation and educational opportunities in Kansas.	KDWP pursuing groups to cooperate with. All sites to date on the Mo R. have been interagency/non-gov. agreements.	
<b>Priority Issue: Watershed Restoration and Protection</b>		
<b>Issue Description:</b> Water quality is addressed through a combination of restoration and protection efforts using both voluntary, incentive-based approaches and regulatory programs. The protection and restoration of watersheds draining to the Missouri River is a high priority in the Missouri Basin. With the urbanization of the southern part of the basin, protection and restoration of these watersheds has become more important.		
<b>Recommended Actions</b>	<b>Status</b>	<b>Comments</b>
1. Work with stakeholder groups to incorporate TMDL implementation, nutrient and sediment reduction, and urban stormwater management goals into applicable WRAPS projects.	A basinwide WRAPs is in development. The mission of the Missouri River Basin WRAPs is to provide the framework for the implementation of water quality improvement practices through technical, informational, educational, and financial assistance. Current focus is on streambank stabilization demonstration projects.	RC&D is coordinating development. A Missouri River Basin Coordinator is focused on the project.
2. Target technical and financial assistance programs for water quality protection and restoration to implement TMDLs and WRAPS action plans.	Delayed Implementation.
